Homework 2. Solutions

1 Consider an upper half-plain (y > 0) in \mathbb{R}^2 equipped with Riemannian metric

$$G = \sigma(x, y)(dx^2 + dy^2)$$

- a) Show that $\sigma > 0$
- b) In the case if $\sigma = \frac{1}{y^2}$ (the Lobachevsky metric) calculate the lengths of vectors $\mathbf{A} = 2\partial_x$ and $\mathbf{B} = 12\partial_x + 5\partial_y$ attached at the point (x,y) = (1,2).
- c) calculate the cosine of the angle between the vectors \mathbf{A} and \mathbf{B} and show that the answer does not depend on the choice of the function $\sigma(x,y)$.
- d) Calculate the length of the segments x=a+t, y=b, and $x=a, y=b+1, 0 \le t \le 1$ in the case if $\sigma=\frac{1}{y^2}$ (Lobachevsky plane)
 - e) Suppose $\sigma(x,y) = \frac{1}{(1+x^2+y^2)^2}$. Consider two curves L_1 and L_2 in upper half-plane such that

$$L_1 = \begin{cases} x = f(t) \\ y = g(t) \end{cases}$$
, and $\begin{cases} x = g(t) \\ y = f(t) \end{cases}$, $0 \le t \le 1$.

Show that these curves have the same length in the case if $\sigma(x,y) = \frac{1}{(1+x^2+y^2)^2}$.

a) $\sigma > 0$ since positive definiteness: e.g. $G(\mathbf{X}, \mathbf{X}) = \sigma(x, y) > 0$ if $\mathbf{X} = \partial_x$.

b)

$$|\mathbf{A}| = \sqrt{G\left(\mathbf{A}, \mathbf{A}\right)} = \sqrt{\frac{A_x^2 + A_y^2}{y^2}} = \sqrt{\frac{2^2 + 0^2}{2^2}} = 1, \ |\mathbf{B}| = \sqrt{G\left(\mathbf{B}, \mathbf{B}\right)} = \sqrt{\frac{B_x^2 + B_y^2}{y^2}} = \sqrt{\frac{12^2 + 5^2}{2^2}} = \frac{13}{2}.$$

c) Calculate the cosine for an arbitrary σ : $\cos(\angle(\mathbf{A}, \mathbf{B})) = \frac{G(\mathbf{A}, \mathbf{B})}{\sqrt{G(\mathbf{A}, \mathbf{A})}\sqrt{G(\mathbf{B}, \mathbf{B})}} = \frac{\langle \mathbf{A}, \mathbf{B} \rangle_G}{|\mathbf{A}||\mathbf{B}|} = \frac{\langle \mathbf{A}, \mathbf{B} \rangle_G}{|\mathbf{A}||\mathbf{B}|}$

$$\frac{\sigma(x,y)\left(A_{x}B_{x}+A_{y}B_{y}\right)}{\sqrt{\sigma(x,y)\left(A_{x}^{2}+A_{y}^{2}\right)}\sqrt{\sigma(x,y)\left(B_{x}^{2}+B_{y}^{2}\right)}}=\frac{\left(A_{x}B_{x}+A_{y}B_{y}\right)}{\sqrt{\left(A_{x}^{2}+A_{y}^{2}\right)}\sqrt{\left(B_{x}^{2}+B_{y}^{2}\right)}}=\frac{2\cdot12+0\cdot5}{1\cdot2\cdot13}=\frac{12}{13}\,.$$

d) Length of the first curve is equal to

$$\int_0^1 \sqrt{\frac{x_t^2 + y_t^2}{y^2(t)}} dt = \int_0^1 \sqrt{\frac{1+0}{b^2}} dt = \frac{1}{b} \,,$$

length of the second curve is equal to

$$\int_0^1 \sqrt{\frac{x_t^2 + y_t^2}{y^2(t)}} dt = \int_0^1 \sqrt{\frac{0+1}{(b+t)^2}} dt = \int_0^1 \frac{1}{b+t} dt = \log\left(1 + \frac{1}{b}\right).$$

- e) If $x \leftrightarrow y$ then metric does not change since $\sigma(x,y) = \sigma(y,x)$: $\sigma(x,y)(dx^2 + dy^2) = \sigma(y,x)(dx^2 + dy^2)$, and $L_1 \leftrightarrow L_2$. Hence lengths of these curves coincide.
- **2** a) Write down explicit formulae expressing stereographic coordinates for n-dimensional sphere $(x^1)^2 + \dots + (x^{n+1})^2 = R^2$ of radius R via coordinates x^1, \dots, x^{n+1} and vice versa.

 (For simplicity you may consider only cases n = 1, 2, 3.)
- b)[†] Check that for unit sphere S^2 ($x^2 + y^2 + z^2 = 1$) all the points with rational cartesian coordinates x, y, z have rational stereographic coordinates u, v and vice versa.
- a) Write down the stereographic projection from the North pole of the sphere–point $N=(0,0,\ldots,R)$ on the plane $x^{n+1}=0$. Consider the segment ND which intersects the sphere at the point (x^1,\ldots,x^{n+1})

 $((x^1)^2 + (x^2)^2 + \ldots + (x^{n+1})^2 = R^2)$. This segment intersects the plane $x^{n+1} = 0$ at the point D with coordinates $x^i u^i$ for $i = 1, \ldots, n$. Then comparing similar triangles we have

$$\frac{R}{R-x^{n+1}} = \frac{u^i}{x^i}$$
, i.e. $u^i = \frac{Rx^i}{R-x^{n+1}}$ $(i = 1, ..., n)$

and

$$x^{i} = \frac{u^{i}(R - x^{n+1})}{R}, \ (i = 1, \dots, n).$$

Using the fact that $(x^1)^2 + \ldots + (x^{n+1})^2 = R^2$ we come to

$$(x^1)^2 + \dots + (x^n)^2 = \frac{(R - (x^{n+1})^2)}{R^2} \sum_{i=1}^n (u^i)^2 = (R - x^{n+1})(R + x^{n+1}).$$

Dividing by $R - x^{n+1}$ ($x^{n+1} \neq R$ since North pole is removed) we come to

$$x^{n+1} = \frac{\sum_{i=1}^{n} (u^{i})^{2} - R^{2}}{\sum_{i=1}^{n} (u^{i})^{2} + R^{2}} R , \quad x^{i} = \frac{2u^{i}R^{2}}{\sum_{i=1}^{n} (u^{i})^{2} + R^{2}} (i = 1, 2, \ldots)$$

For projection with centre in South pole we have to change $x^{n+1} \mapsto -x^{n+1}$.

Write down these formulae for cases n = 1, 2, 3,

Case n = 1: Circle $x^2 + y^2 = R^2$. Stereographic coordinate t. Centre of projection (0, R):

$$t = \frac{Rx}{R - y}, \qquad \begin{cases} x = \frac{2tR^2}{R^2 + t^2} \\ y = \frac{t^2 - R^2}{t^2 + R^2} R \end{cases}$$
 (1)

Case n = 2: Sphere $x^2 + y^2 + z^2 = R^2$. Stereographic coordinates u, v. Centre of projection (0, 0, R):

$$\begin{cases} u = \frac{Rx}{R-z} \\ v = \frac{Ry}{R-z} \end{cases}, \qquad \begin{cases} x = \frac{2uR^2}{R^2 + u^2 + v^2} \\ y = \frac{2vR^2}{R^2 + u^2 + v^2} \\ z = \frac{u^2 + v^2 - R^2}{u^2 + v^2 + R^2} R \end{cases}$$
 (2)

Case n = 3: 3-dimensional sphere $x^2 + y^2 + z^2 + t^2 = R^2$. Stereographic coordinates u, v, w. Centre of projection $(0, 0, 0, R^2)$:

$$\begin{cases} u = \frac{Rx}{R - t} \\ v = \frac{Ry}{R - t} \\ w = \frac{Rz}{R - t} \end{cases}, \qquad \begin{cases} x = \frac{2uR^2}{R^2 + u^2 + v^2 + w^2} \\ y = \frac{2vR^2}{R^2 + u^2 + v^2 + w^2} \\ z = \frac{2wR^2}{R^2 + u^2 + v^2 + w^2} \\ z = \frac{u^2 + v^2 + w^2 - R^2}{u^2 + v^2 + w^2 + R^2} R \end{cases}$$
(2)

- b)[†] We see that from explicit formulae. This is rational transformation of conic surfaces.
- ${f 3}$ Consider the Riemannian metric on the circle of the radius R induced by the Euclidean metric on the ambient plane.
 - a) Express it using polar angle as a coordinate on the circle.
- b) Express the same metric using stereographic coordinate t obtained by stereographic projection of the circle on the line, passing through its centre.

Riemannian metric of Euclidean space is $G = dx^2 + dy^2$.

a) using the angle: In this case parametric equation of circle is $\begin{cases} x = R\cos\varphi \\ y = R\sin\varphi \end{cases}$. Then

$$G = \left(dx^2 + dy^2 \right) \big|_{x = R\cos\varphi, y = R\sin\varphi} = \left(d\cos\varphi \right)^2 + \left(d\sin\varphi \right)^2 = R^2 d\varphi^2 \,.$$

b) In stereographic coordinate using (1) and the fact that

$$y = R\frac{t^2 - R^2}{t^2 + R^2} = R\left(1 - \frac{2R^2}{t^2 + R^2}\right)$$

we have that

$$G = (dx^2 + dy^2)\big|_{x=x(t),y=y(t)} = \left(d\left(\frac{2tR^2}{R^2 + t^2}\right)\right)^2 + \left(d\left(\frac{t^2 - R^2}{R^2 + t^2}R\right)\right)^2 =$$

$$\left(\frac{2R^2dt}{R^2 + t^2} - \frac{4t^2R^2dt}{(R^2 + t^2)^2}\right)^2 + \left(-\frac{4R^2tdt}{(t^2 + R^2)^2}\right)^2 = = \frac{4R^4dt^2}{(R^2 + t^2)^2} \blacksquare$$

- 4 Consider the Riemannian metric on the sphere of the radius R induced by the Euclidean metric on the ambient 3-dimensional space.
 - a) Express it using spherical coordinates on the sphere.
- b) Express the same metric using stereographic coordinates u, v obtained by stereographic projection of the sphere on the plane, passing through its centre.

Solution

Riemannian metric of Euclidean space is $G = dx^2 + dy^2 + dz^2$.

a) using the spherical coordinates: In this case parametric equation of sphere is $\begin{cases} x = R \sin \theta \cos \varphi \\ y = R \sin \theta \sin \varphi \end{cases}$ Then

$$G = \left. \left(dx^2 + dy^2 + dz^2 \right) \right|_{x = R\sin\theta\cos\varphi, y = R\sin\theta\sin\varphi, z = R\cos\theta} = R^2 \left. \left(\left(d\sin\theta\cos\varphi \right) \right)^2 + R^2 \left. \left(\left(d\sin\theta\sin\varphi \right) \right)^2 + R^2 \left. \left(\left(d\cos\theta \right) \right)^2 + R^2 \left. \left(d\cos\theta \right) \right)^2 \right|_{x = R\sin\theta\cos\varphi, y = R\sin\theta\sin\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right)^2 + R^2 \left. \left(d\sin\theta\sin\varphi \right) \right|_{x = R\sin\theta\cos\varphi, y = R\sin\theta\sin\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, y = R\sin\theta\sin\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, y = R\sin\theta\sin\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, y = R\sin\theta\sin\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\sin\theta\cos\varphi, z = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta} = R^2 \left. \left(d\sin\theta\cos\varphi \right) \right|_{x = R\cos\theta}$$

$$R^{2}\left(\cos\theta\cos\varphi d\theta-\sin\theta\sin\varphi d\varphi\right)^{2}+R^{2}\left(\cos\theta\sin\varphi d\theta+\sin\theta\cos\varphi d\varphi\right)^{2}+R^{2}\left(-\sin\theta d\theta\right)^{2}=R^{2}d\theta^{2}+R^{2}\sin^{2}\theta d\varphi^{2}.$$

b) in stereographic coordinates using (2) we have $G = (dx^2 + dy^2 + dz^2)\big|_{x=x(u,v),y=y(u,v),z=z(u,v)} = 0$

$$\left(d\left(\frac{2uR^2}{R^2+u^2+v^2}\right)\right)^2 + \left(d\left(\frac{2vR^2}{R^2+u^2+v^2}\right)\right)^2 + \left(d\left(1-\frac{2R^2}{R^2+u^2+v^2}\right)R\right)^2 =$$

$$R^4 \left(\frac{2du}{R^2+u^2+v^2} - \frac{2u(2udu+2vdv)}{(R^2+u^2+v^2)^2}\right)^2 + R^4 \left(\frac{2dv}{R^2+u^2+v^2} - \frac{2v(2udu+2vdv)}{(R^2+u^2+v^2)^2}\right)^2 + \frac{16R^6(udu+vdv)^2}{(R^2+u^2+v^2)^4} =$$

$$\frac{4R^4}{(R^2+u^2+v^2)^2} \left[\left(du - \frac{2u(udu+vdv)}{R^2+u^2+v^2}\right)^2 + \left(dv - \frac{2v(udu+vdv)}{R^2+u^2+v^2}\right)^2 + \frac{4R^2(udu+vdv)^2}{(R^2+u^2+v^2)^2}\right] =$$

$$\frac{4R^4(du^2+dv^2)}{(R^2+u^2+v^2)^2} \blacksquare$$

Remark

In the case of n-dimensional sphere S^n of radius R in (n+1)-dimensional Euclidean space \mathbf{E}^{n+1} (it can be defined by the equation $(x^1)^2 + \ldots + (x^{n+1})^2 = R^2$ in Cartesian coordinates $x^1, \ldots, x^n, x^{n+1}$) Riemannian metric on this sphere induced by the Euclidean metric in the ambient space in stereographic coordinates has following appearance:

$$G = \left((dx^{1})^{2} + \ldots + (dx^{n+1})^{2} \right) \Big|_{x^{\mu} = x^{i}(u^{i})} = \left(\sum_{j=1}^{n} \left(d \left(\frac{2R^{2}u^{j}}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} \right) \right) \right)^{2} + \left(d \left(R \frac{\sum_{i=1}^{n} (u^{i})^{2} - R^{2}}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} \right) \right)^{2} = \left(\frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} \right) \right)^{2} + \left(\frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} \right) \right)^{2} = \left(\frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} \right) \right)^{2} = \left(\frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} \right) \right)^{2} = \left(\frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} \right) \right)^{2} = \left(\frac{1}{R^{2} + \sum_{i=1}^{n} (u^{i})^{2}} + \frac{1}{R^{$$

$$=\frac{4R^4\sum_{i=1}^n(du^i)^2}{(R^2+\sum_{i=1}^n(u^i)^2)^2}$$

5 Consider the surface L which is the upper sheet of two-sheeted hyperboloid in \mathbb{R}^3 :

L:
$$z^2 - x^2 - y^2 = 1$$
, $z > 0$.

a) Find parametric equation of the surface L using hyperbolic functions cosh, sinh following an analogy with spherical coordinates on the sphere.

(The surface L sometimes is called pseudo-sphere.)

b) Consider the stereographic projection of the surface L on the plane OXY, i.e. the central projection on the plane z = 0 with the centre at the point (0, 0, -1).

Show that the image of projection of the surface L is the open disc $x^2 + y^2 < 1$ in the plane OXY.

a) Parametric equation is $\begin{cases} x = \sinh\theta\cos\varphi \\ y = \sinh\theta\sin\varphi \end{cases}$ We see that the condition $z^2 - x^2 - y^2 = 1$ is fulfilled. (Compare with equation of sphere in spheric coordinates.)

b) Calculations are very similar to the case of stereographic coordinates for 2-sphere $x^2 + y^2 + z^2 = 1$ of the radius R=1. Stereographic coordinates u,v. Centre of projection (0,0,-1): We have $\frac{u}{x}=\frac{v}{y}=\frac{1}{1+z}$. Hence $\begin{cases} u = \frac{x}{1+z} \\ v = \frac{y}{1+z} \end{cases}$. Since x = u(1+z), y = v(1+z) then $z^2 - 1 = x^2 + y^2$ and $z^2 - 1 = (u^2 + v^2)(1+z)^2$, i.e. $z = \frac{1+u^2+v^2}{1-u^2-v^2}$. We come to

$$\begin{cases} u = \frac{x}{1+z} \\ v = \frac{y}{1+z} \end{cases}, \qquad \begin{cases} x = \frac{2u}{1-u^2-v^2} \\ y = \frac{2v}{1-u^2-v^2} \\ z = \frac{u^2+v^2+1}{1-u^2-v^2} \end{cases}, \quad u^2 + v^2 < 1.$$

$$(4)$$

The image of upper-sheet is an open disc $u^2 + v^2 < 1$ since $u^2 + v^2 = \frac{x^2 + y^2}{(1+z)^2} = \frac{z^2 - 1}{(1+z)^2} = \frac{z-1}{z+1}$. Since for upper-sheet is an open disc $u^2 + v^2 < 1$ since $u^2 + v^2 = \frac{z^2 + y^2}{(1+z)^2} = \frac{z^2 - 1}{(1+z)^2} = \frac{z-1}{z+1}$. sheet z > 1 then $0 \le \frac{z-1}{z+1} < 1$.

 6^* Consider the pseudo-Riemannian, pseudo-Euclidean metric on \mathbb{R}^3 given by the formula

$$ds^2 = dx^2 + dy^2 - dz^2.$$

Calculate the induced metric on the surface L considered in the Exercise 4, and show that it is a Riemannian metric (it is positive-definite).

Perform calculations in spherical-like coordinates (see Exercise 4a) above) and in stereographic coordinates (see exercise 4b) above)

In stereographic coordinates we come to realisation of Lobachevsky plane on the disc in \mathbf{E}^2 . It is so called Poincare model of Lobachevsky geometry.

Solution. The calculations will be very similar to the calculations performed in the exercise 3 above. Just we need consider $\cosh \theta$, $\sinh \theta$ instead $\cos \theta$, $\sin \theta$ and and sometimes changes the signs.

First of all consider spherical-like coordinates:

Equation of two-sheeted hyperboloid is
$$\begin{cases} x = \sinh \theta \cos \varphi \\ y = \sinh \theta \sin \varphi \end{cases}$$
. Then
$$z = \cosh \theta$$

$$G = (dx^2 + dy^2 - dz^2)\big|_{x = \sinh\theta\cos\varphi, y = \sinh\theta\sin\varphi, z = \cosh\theta} = ((d\sinh\theta\cos\varphi))^2 + ((d\sinh\theta\sin\varphi))^2 - ((d\cosh\theta))^2 = (dx^2 + dy^2 - dz^2)\big|_{x = \sinh\theta\cos\varphi, y = \sinh\theta\sin\varphi, z = \cosh\theta} = ((d\sinh\theta\cos\varphi))^2 + ((d\sinh\theta\sin\varphi))^2 - ((d\cosh\theta))^2 = ((d\sinh\theta\cos\varphi))^2 + ((d\sinh\theta\sin\varphi))^2 - ((d\cosh\theta))^2 + ((d\sinh\theta\cos\varphi))^2 + ((dh\phi\cos\varphi))^2 + ((dh\phi\phi))^2 + ((dh\phi))^2 + ((dh\phi))$$

$$\left(\cosh\theta\cos\varphi d\theta-\sinh\theta\sin\varphi d\varphi\right)^{2}+\left(\cosh\theta\sin\varphi d\theta+\sinh\theta\cos\varphi d\varphi\right)^{2}+\left(\sinh\theta d\theta\right)^{2}=d\theta^{2}+\sinh^{2}\theta d\varphi^{2}\,.$$

matrix of Riemannian metric is $G = \begin{pmatrix} 1 & 0 \\ 0 & \sinh^2 \theta \end{pmatrix}$. In the same way as for sphere these coordinates are well-defined in all points except $z = \pm 1$, where $\sin^2 \theta = 0$.

Now express Riemannian metric in stereographic coordinates (4):

$$G = (dx^{2} + dy^{2} - dz^{2})\big|_{x = x(u,v), y = y(u,v), z = z(u,v)} = \left(d\left(\frac{2u}{1 - u^{2} - v^{2}}\right)\right)^{2} + \left(d\left(\frac{2v}{1 - u^{2} - v^{2}}\right)\right)^{2} - \left(d\left(\frac{2}{1 - u^{2} - v^{2}} - 1\right)\right)^{2}$$

$$= \left(\frac{2du}{1 - u^{2} - v^{2}} + \frac{2u(2udu + 2vdv)}{(1 - u^{2} - v^{2})^{2}}\right)^{2} + \left(\frac{2dv}{1 - u^{2} - v^{2}} + \frac{2v(2udu + 2vdv)}{(1 - u^{2} - v^{2})^{2}}\right)^{2} - \frac{16(udu + vdv)^{2}}{(1 - u^{2} - v^{2})^{4}} =$$

$$= \frac{4(du)^{2} + 4(dv)^{2}}{(1 - u^{2} - v^{2})^{2}}.$$

(Compare with calculations for sphere $x^2 + y^2 + z^2 = 1$).

Resume: We come to Riemannian metric on the surface L induced by pseudo-Riemannian metric in ambient space.

Remark The surface L sometimes is called pseudo-sphere. The Riemannian metric on this surface sometimes is called Lobachevsky (hyperbolic) metric. The surface L with this metric realises Lobachevsky (hyperbolic) geometry, where Euclid's 5-th Axiom fails. This Riemannian manifold (manifold+Riemannian metric) is called Lobachevsky (hyperbolic) plane. In stereographic coordinates Lobachevsky plane is realised as an open disc $u^2 + v^2 < 1$ in \mathbf{E}^2 . It is so called Poincare model of Lobachevsky geometry. In the exercise 8 below we will consider realisation of Lobachevsky plane as upper half-plane.

7* In the exercises 5 and 6 we showed that pseudo-Euclidean metric (1) in \mathbb{R}^3 induces Riemanian metric on two-sheeted hyperboloid $z^2 - x^2 - y^2 = 1$. Show that it is not true for one-sheeted hyperboloid: metric on one-sheeted hyperboloid $x^2 + y^2 - z^2 = 1$ in \mathbb{R}^3 is not Riemannian if it is induced with the pseudo-Euclidean metric (1).

Solution. One can perform straightforward calculations in spherical-like coordinates: Equation of one-sheeted hyperboloid is $\begin{cases} x = \cosh\theta\cos\varphi \\ y = \cosh\theta\sin\varphi \end{cases}.$ Then $z = \sinh\theta$

$$G = (dx^2 + dy^2 - dz^2)\big|_{x = \cosh\theta\cos\varphi, y = \cosh\theta\sin\varphi, z = \sinh\theta} = ((d\cosh\theta\cos\varphi))^2 + ((d\cosh\theta\sin\varphi))^2 - ((d\sinh\theta))^2 = (dx^2 + dy^2 - dz^2)\big|_{x = \cosh\theta\cos\varphi, y = \cosh\theta\sin\varphi, z = \sinh\theta} = ((d\cosh\theta\cos\varphi))^2 + ((d\cosh\theta\sin\varphi))^2 - ((d\sinh\theta))^2 = (dx^2 + dy^2 - dz^2)\big|_{x = \cosh\theta\cos\varphi, y = \cosh\theta\sin\varphi, z = \sinh\theta} = ((d\cosh\theta\cos\varphi))^2 + ((d\cosh\theta\sin\varphi))^2 - ((d\sinh\theta))^2 = ((d\cosh\theta\cos\varphi))^2 + ((d\cosh\theta\sin\varphi))^2 + ((d\cosh\theta\sin\varphi))^2 + ((d\cosh\theta\cos\varphi))^2 + ((d\cosh\theta\sin\varphi))^2 + ((d\cosh\theta\cos\varphi))^2 + ((d\cosh\phi))^2 + ((dh\phi))^2 +$$

$$\left(\sinh\theta\cos\varphi d\theta - \cosh\theta\sin\varphi d\varphi\right)^2 + \left(\sinh\theta\sin\varphi d\theta + \cosh\theta\cos\varphi d\varphi\right)^2 - \left(\cosh\theta d\theta\right)^2 = -d\theta^2 + \cosh^2\theta d\varphi^2.$$

matrix is $G = \begin{pmatrix} -1 & 0 \\ 0 & \cosh^2 \theta \end{pmatrix}$. The condition of positive-definiteness is not fulfilled. This is not Riemannian metric.

Another solution Consider the vectors $\mathbf{e} = \frac{\partial}{\partial y}$ and $\mathbf{f} = \frac{\partial}{\partial z}$ attached at the point (1,0,0). One can see that these vectors are tangent to the hyperboloid, but they have the "length" of different sign. (One of these vectors is space-like vector, another time like vector.) We have pseudoriemannian metric at the tangent space spanned by these two vectors.

 8^* In the exercise 6 we realised Lobachevsky plane as a disc $u^2 + v^2 < 1$. Find new coordinates x, y such that in these coordinates Lobachevsky plane (hyperbolic plane) can be considered as an upper half plane $\{(x,y):\ y>0\}$ in \mathbf{E}^2 and write down explicitly Riemannian metric in these coordinates.

Hint: You may use complex coordinates:

$$z = x + iy, \bar{z} = x - iy, \omega = u + iv, \bar{w} = u - iv$$

and consider a holomorphic transformation:

$$\omega = \frac{1+iz}{1-iz} \Leftrightarrow z = i\frac{1-\omega}{1+\omega},$$

which transforms the open disc $w\bar{w} < 1$ onto the upper plane Im z > 0.

Solution.

Recall that in the previous exercise we calculated expression for Lobachevsky metric in stereographic coordinates $u, v, u^2 + v^2 < 1$. We come to the answer: $G = \frac{4du^2 + 4dv^2}{(1 - u^2 - v^2)^2}$ (see exercise 6). (It was realisation of Lobachevsky plane on the Euclidean disc, so called Poincare model of Lobachevsky (hyperbolic) geometry.)

In complex coordinates $\omega = u + iv$, $\bar{\omega} = u - iv$ the metric $G = \frac{4du^2 + 4dv^2}{(1 - u^2 - v^2)^2}$ obtained in the exercise 6 can be rewritten $G = \frac{4dwd\bar{w}^2}{(1 - w\bar{w})}$. Indeed

$$G = \frac{4d\omega d\bar{\omega}}{(1 - w\bar{w})^2} = G = \frac{4d(u + iv)d(u - iv)}{(1 - (u + iv)(u - iv))^2} = \frac{4du^2 + 4dv^2}{(1 - u^2 - v^2)^2}.$$

Now consider Mobius transformation $\omega = \frac{1=iz}{1-iz}$, which transforms the disc, interior of circle $\omega \bar{\omega} = 1$ onto upper half plane Imz > 0. One can see that

$$\omega = \frac{1+iz}{1-iz}, \qquad z = i\frac{1-\omega}{1+\omega}$$

(Can you find all Mobius transformations which transform upper half plane to the interior of unit circle?.) Now calculate G in coordinates z, \bar{z} . i.e. in coordinates (x, y):

$$G = \frac{4du^2 + 4dv^2}{(1 - u^2 - v^2)^2} = \frac{4dwd\bar{w}}{(1 - w\bar{w})^2}$$

We have

$$d\omega = d\left(\frac{1+iz}{1-iz}\right) = \frac{2idz}{(1-iz)^2}, d\bar{\omega} = \frac{-2id\bar{z}}{(1+i\bar{z})^2},$$

$$1 - \omega \bar{\omega} = 1 - \frac{1 + iz}{1 - iz} \frac{1 - i\bar{z}}{1 + i\bar{z}} = \frac{2i(\bar{z} - z)}{(1 - iz)(1 + i\bar{z})}$$

Hence

$$G = \frac{4d\omega d\bar{\omega}}{(1 - \omega\bar{\omega})^2} = \frac{4\left(\frac{2idz}{(1 - iz)^2}\right)\left(\frac{-2id\bar{z}}{(1 + i\bar{z})^2}\right)}{\frac{-4(\bar{z} - z)^2}{(1 - iz)^2(1 + i\bar{z})^2}} = \frac{-4dd\bar{z}}{(\bar{z} - z)^2} = \frac{dx^2 + dy^2}{y^2},$$

since z = x + iy and $\bar{z} - z = -2iy$.

We come to the very useful and nice interpretation of hyperbolic geometry: upper half plane in \mathbf{E}^2 with metric $G = \frac{dx^2 + dy^2}{y^2}$. Later by default we will call "Lobachevsky (hyperbolic) plane" the realisation of Lobachevsky plane as an half-upper plane in \mathbf{E}^2 with these coordinates x, y (y > 0) with metric $G = \frac{dx^2 + dy^2}{y^2}$.

Remark What will happen if we consider another Mobius transformation of disc $\omega \bar{\omega} < 1$ onto plane Im z > 0?
